

AI writes a lot of our code. It doesn't get the last word.

A two-person mobile studio. Agents do the volume work. Then a person reviews the architecture, tests on real phones, and signs off on security.

Look around the floor

Sahib Singh

Keenai Global

2025 – now

Motive

2023 – 2025

Sahib's work in full

Tanya Jain

Motive

2024 – now

HSBC

2021 – 2023

Tanya's work in full

Four things we don't hand to an agent.

01 **Architecture review.**

Sahib decides the shape before a line is written: what the data looks like, where the boundaries are, what this has to survive in two years. Agents are good at filling in a structure and bad at choosing one.

02 **Code review.**

Every change is read by a person before it merges, and both of us are on this one. Not skimmed for style. Read for whether it does what it claims.

03 **QA on real devices.**

Tanya runs the build on physical phones, not just an emulator. Slow networks, low battery, older Android versions, the states people actually hit.

04 **Security and privacy review.**

Tanya reads what the app collects, where it goes, what's stored and what's exposed, against what we told your users we'd do.

Design review and the release itself stay with Sahib and Tanya: both read the layouts before build, and both names go on every release.

That's the difference between generated software and shipped software.

We run this on our own app first.

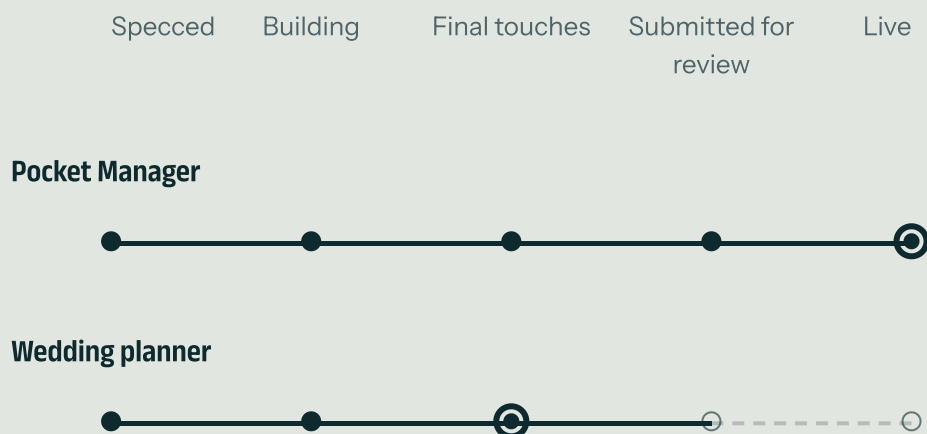

Pocket Manager has been in the Play Store since 2020, maintained by the same pipeline and the same review gates. 4.3 stars from 24 reviews, 1,000+ downloads, and it still gets updates five years on.

4.3	24	1,000+
stars	reviews	downloads

A second app sits behind it in final touches, built through the same pipeline and stopped at the same gates. There's no date on it. The list of what's left is short, and a person decides when it ends.

[Open Pocket Manager in the Play Store](#)

[Read how it gets built](#)

One shipped, one nearly there.

The track shows both products and where each one actually is: Pocket Manager shipped and still updated, the second one close enough that the list of what's left is short. Neither carries a date, and neither will. A date we miss in public is worse than no date at all.

You'll be holding something before you're bored of the kickoff.

The first thing we hand over is a working build you can open on your phone. Not a deck, not a Figma walkthrough, not a status update. Everything after that is iteration on a thing that already runs.

One project at a time. Fixed scope or a retainer, both work here. It starts with a short written brief rather than a call, and a first MVP is a few days from the go-ahead.

Tell us what you're building.

One email, a real reply from one of us, and a straight answer about whether we're the right fit. If we're not, we'll say so.
